

Click on the desired server.

Select a service to configure: DNS/HTTP/FTP/MAIL

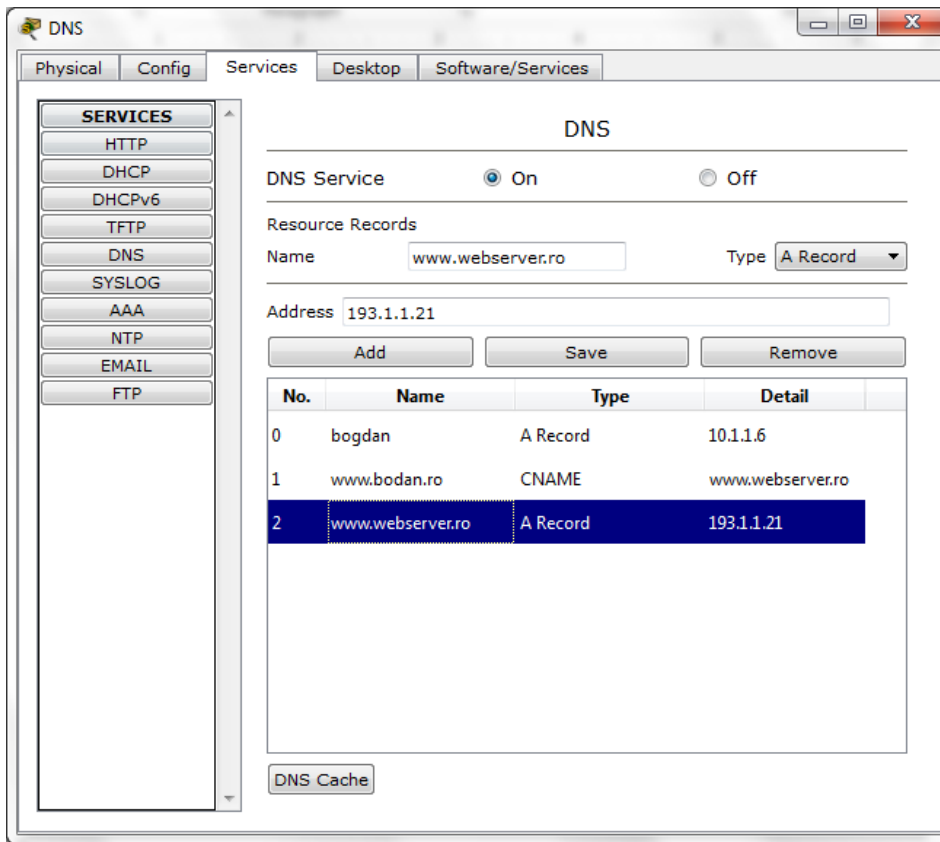

Configuring a DNS server:

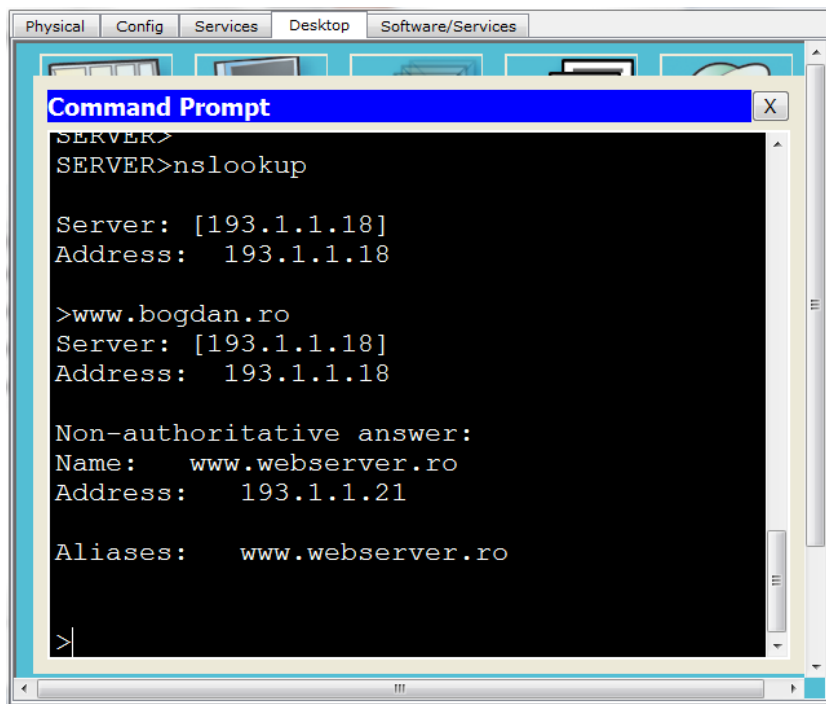

- All the devices should have a DNS server address (verify you have assigned an DNS address using either DHCP service or statically assign the address)

- Add entries (Name and address)

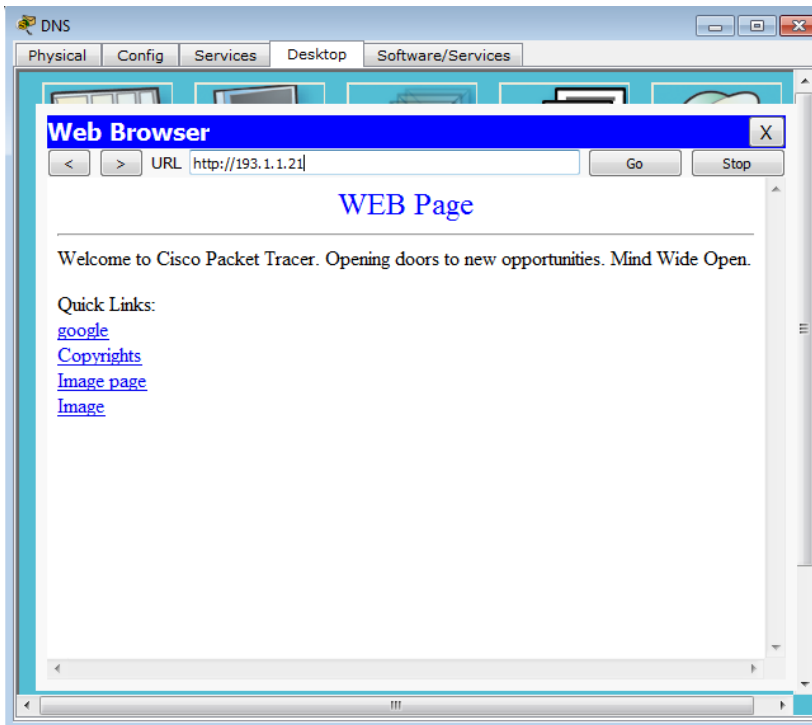

- c. Test the DNS service:
 - a. Open command prompt on a network host
 - b. Enter the **nslookup** command
 - c. Test with a define Name or IP address

Test HTTP services with a IP address and a Name:

- a. Open a on a web browser on a network host
- b. Connect to the HTTP server using an IP address

- c. Connect to the HTTP server using an Name (previously defined and mapped to an IP address in DNS)
